RESEARCH FOCUS

Machine-learning interatomic potentials (MLIP) and active-learning workflows for large-scale atomistic simulation; thermal transport, phonon dynamics, and symmetry-adapted methods for low-dimensional materials.

SELECTED HIGHLIGHTS

- First-author paper in npj Computational Materials (2026): symmetry-adapted Atomistic Green's Function method for thermal transport in defect-laden quasi-1D systems.
- Lead developer of pulgon_tools — open-source Python package for line-group symmetry analysis (submitted to Computer Physics Communications).
- Trained equivariant MLIPs (Allegro, NEP) for CNT and TMD nanotubes via active learning.

TECHNICAL SKILLS

ML for atomistic simulation	Allegro, MACE, NequIP, NEP (GPUMD)
Languages & frameworks	Python, MATLAB, PyTorch, JAX, C++ (basic), Bash
Atomistic codes	VASP, GPUMD, LAMMPS, ASE, Phonopy, pymatgen
Thermal & transport methods	Green-Kubo, GKMA, HNEMA, SED · Atomistic Green's Function · BTE
Infrastructure	SLURM, Git, Linux

EDUCATION

PhD in Materials Chemistry · TU Wien, Austria · Jul 2023 – Present (expected late 2026)
Supervisor: Prof. Georg K. H. Madsen (Institute of Materials Chemistry, E165, TU Wien)
Co-supervisor: Dr. Jesús Carrete Montaña (INMA, CSIC–Univ. Zaragoza, Spain)

MS in Theoretical Physics · South China University of Technology · Sept 2020 – Jul 2023

BS in Physics · South China University of Technology · Sept 2016 – Jul 2020

RESEARCH EXPERIENCE

PhD Candidate · TU Wien · Jul 2023 – Present

Symmetry-adapted MLIP-driven thermal transport in quasi-1D systems *(in preparation)*
Extending Green-Kubo Modal Analysis (GKMA) and HNEMA with line-group projector operators so every phonon mode carries a well-defined irrep label. Trained a NEP foundation-model fine-tune for (10,0) CNT via two-round active learning (VASP/PBEsol-D3 reference): 1.04 meV/atom energy RMSE, 120 meV/Å force RMSE; production GPUMD trajectories (10–40 ns, 200–400 K) confirm irrep-summed $\kappa = 2538$ W m^{-1} K^{-1} is invariant across basis constructions, demonstrating physically interpretable symmetry-resolved thermal conductivity.

Ab-initio heat transport in defect-laden quasi-1D systems *(npj Computational Materials, 2026 · first author)*
Discovered that strong symmetry breaking can *enhance* thermal conductance in WS_2/MoS_2 multi-wall nanotubes by relaxing line-group selection rules and opening previously forbidden phonon channels — a counterintuitive result established with a symmetry-adapted, mode-resolved Atomistic Green's Function (AGF) framework that fuses representation theory with line-group projector techniques to label phonon transmission by irrep. An Allegro-based equivariant MLIP supplied interatomic force constants at near-DFT accuracy, and Green-Kubo MD confirmed the conclusion at finite temperature.

pulgon_tools *(Computer Physics Communications, submitted · first author, lead developer)*
Open-source Python/CLI package for quasi-1D systems: chiral-rolling and symmetry-based structure generation, line-group detection (axial point group + generalized translation group), q-point–resolved character tables and irrep matrices, and convex-optimisation–based symmetrisation of force constants (enforcing translational and Born–Huang rotational sum rules). Apache-2.0 licensed with CLI entry points, test suite, and PyPI release.
github.com/pulgon-project/pulgon_tools

Symmetry-guided high-throughput search for alloy ground states *(Physical Review Materials, 2022 · first author)*
Partitioned the cluster-expansion correlation-function space by symmetry (Wyckoff-position index) so the convex hull can be solved subspace-by-subspace, drastically cutting the candidate set for first-principles screening. Applied to Ni–Pt, Ag–Pd, Os–Ru, Ir–Ru, and Mo–Ru, recovering known ground states and predicting several new lower-energy configurations.
